Ruby - Feature #6811

File, Dir and FileUtils should have bang-versions of singleton methods that fails silently

Description

I found that often write

Dir.mkdir(folder) unless Dir.exist? folder and similar code for rm, rm_rf and so on We can simply make bang-versions like def Dir.mkdir!(folder, permissions=0744)

Dir.mkdir(folder, permissions) unless Dir.exist? folder

or another alternative Dir.mkdir(folder, permissions) rescue false

end

At least for mkdir you can use mkdir p, although it annoyingly warns about missing path if \$VERBOSE=true (can we consider that a bug please?).

Bang methods are not usually used for that in Ruby core and stdlib.

I agree for the practical point of view of this though.

I'm unsure what a good name would be.

Using mkdir_p for this seems a bit dangerous, as it might create intermediary directories you did not intend to.

Sorry, it is if \$DEBUG = true, not \$VERBOSE.

Here's the issue:

FileUtils.mkdir_p('a/b/c/d')

Exception Errno::ENOENT' at /home/trans/.local/lib/ry/rubies/1.9.3-p125/lib/ruby/1.9.1/fileutils.rb:247 - No such file or directory - a/b/c/d Exception Errno::EEXIST' at /home/trans/.local/lib/ry/rubies/1.9.3-p125/lib/ruby/1.9.1/fileutils.rb:247 - File exists - . => ["a/b/c/d"]

It the most annoying warning, and I always end-up writing my own method instead. =end

Ah, I see, this is due to the exception-driven implementation of FileUtils. I think it would be worth discussing it in a separate issue.

First, let me apologize to everyone for expressing opinion, while having relatively little experience. I like your proposal, but I am concerned about feature creep. Maybe those convenience features should go to stdlib, just like eg. require 'mathn' changes math behavior, we could have require 'fileboost' or something making FileUtils fatter. I think that in the future, there will be many amazing proposals for FileUtils functionality, like yours here, so the best of them could go to this 'fileboost' or whatever other name would it have.
